From tweeting to tooting

Two front runners have emerged as alternatives in the wake of Musk's chaotic takeover, but they're some distance from viably competing with Twitter

The takeover of Twitter by Elon Musk and his attempts at reorganisation have caused chaos and uncer-

mpts at recognisation have caused chace and uncertainty. As a result, there's been a jump in interest in alternative microbiogoging platforms.

We know from patterns on Facebook, instagram and Thi-Tok—and Twitter itself—that social media users tend to be "sticky" and nasly change platforms thought bey may use several platforms with different functionalities. There is usually room for just one player in a given social media segment—one Facebook, one Insts., one Twitter, one TiltiCki However, we've also seen the examples of My-Space and Otkui. Those platforms boasted user bases upwards of nine digits before they collapsed and Facebook took over that space. So change, when it comes, can be catastrophic.

In the microbiogoging space, Twitter has 238 million active daily users. It has far more global reach than the weibos, Chinese microbiogoging platforms with larger user-bases. (Weibo is the generic Chinese word for incrobioe and the most roouler

is the generic Chinese word for microblogand the most popular Sina Weibo and Tencent Weibo have over 500 million regular

users in aggregate).

If we assume Twitter users will not consider welbos a serious alternative, Twitter has an enormous lead over any potential rival. Mastodon and Bluesky Social seem to be the front run

Mastodon is the best known Mastodon is the best known of the Twitter wannabes and it has just over one million active with the series of the series much the same functionalities.

Mastodon is the best known of the series users much the same functionalities. But the series of the s

much the same functionalities. Bluesely is mother social network. This was recently launded by Twitter Founder Jack Dossey. It has a similar architectural philosophy to Mastodon. The first crucial difference vis-a-vis Twitter is that Mastodon and Bluesely are federated, open-source set-ups. - Mastodon has just over 1 mn active users; Bluesky Social recently launched by Twitter Founder Jack Dorsey, Is also a rival of Twitter
- Mastodon and Bluesky Mastodon and Bluesky are federated, open-source set-ups. They are decentralised with no single server or central node controlling flows; anyone can set up a server and host users

- Anding somebody on Mastodon is tricky, more difficult than the Twitter search equivalent
- Unlike Twitter, the owner of a Mastodon server is responsible for modera-ting content on it
- The biggest issue for the federated rival networks is monetary compensation; Mastodon has a no-ads policy, Bluesky's revenue model is also not clear

ling flows. Anybody who's inter-ested can set up a server and hoet users by downloading the software. Since the software is open-esuroz, geeles can tweak it as weld. These are peer-to-peer networks. Any nodeon the net-work can speak to every other node on the network and no node has extra orivilaent (it's called tooting) you would on Twitter. Mastodon servers allow longer toots (minimum 500 characters) than tweets. Video and audio can also be posted, with size limits. People can find and follow you, and you can find and follow others including accounts on different to the control of the control o

mode on the network and no mode has extra privileges. There is no Toos server', or single-me and the work administrator.

Users can choose server and setup an account. Bluesky is at all in batts are you may

as erver and set up an account. Bluesley is st. III in beta so you may have to wait to set up a Bluesly account.

Many Mastodon servers-arealso experiencing overloads due to the sudden influx of new accounts, as Twitter uses migrate or set up secondary accounts. But let's any you set up an account on Mastodon. You can now post the same sort of com-

gaccounts on different servers. Finding som-ebody is a tricky pro-cess, by the way, and more difficult than the Twitter search equivalent. It is likely to remain more cum-

due to the idiosyncratic prefer-ences of individual hosts. German servers (Mastodon has German origins so there are a lot of German and other Euronot or German and other Euro-pean Union servers) tend to be hypersensitive to content on

pean union servers; send to be hypersensitive to content on fascism. There are religioussensitivities on some servers, etc. Unlike Twitter with itsglobel moderation team (which has reportedly been langely laid off), the owner of a Mastodon server is responsible for moderating content on that server. If a host persistently allows objectionable content to be toted, other servers can block accessor even take concerted action to cut that server out of the network. So you could, for instance, have a host whoenjoys conspiracy theories and allows accounts to generate such content. But if other server hosts don't like this content, it would be isolated to one small poisonous bubble.

erated rival networks is monet-ary compensation. Twitter finds it hard enough to generate reve-nue. Mastodon has a no-ads pol-

tent may be dow content may be downloaded and an authorised application may access your public profile information, your following list, your followers, your lists, all your posts, and your favourites. App-lications can never access your e-mail address or password. This severely restricts mometising the

one small poisonous bubble. That's how this type of federat-That's how this type of tederat-ed network is supposed to work in theory. Frankly, we don't know how this will pan out at scale, in practice. The biggest issue for the fed-erated rival networks is monet-

nue Mastodon has a no-ads poli-icy, and host smast undertake not to "sell, trade, or otherwise transfer to cutside perites, any personally klentifiable informa-tion". Trusted third parties who assist in operations must agree to keep personal data confiden-tial. This data may only be releas-ed to comply with legal requests.
